

First create an azure free account with the id which u have given

Now following shiva prasad koirala video first one

Suppose u want to host a website and you are going to hosting provider what he will give u lot of services like hard disk ,bandwidth ,allocate u ram and allocate u cpu and he has to allocate

virtual machines and give u softwares and so many things now those things which he is giving is broadly classified into three categories as shown below

So infrastructure has got all those things routers ,networking something which is metal and physical one okay is available here

So to make this metal alive means hardware run i need a platform which has different os and DB(sql server ,oracle),framework(java,.net) and web server(IIS,apache) and all okay .

And application softwares comes in SAAS layer

So if u want to do all this thing by yourself means u have to check for data center and then look for license agreement etc so u need network guys ,technicians ,data base guys etc and all okay

And hardware engineers and so on and so after doing all this also u may not get correct setup so how I need is like this three things i need here

Elastic ,flexible and want to pay as u use okay..

So cloud needs two things onDemand and Outsourced okay

Means i want right now 1 gb ram and 200gb hard disks for 10 days

So first demand is that it should be flexible ,elastic in nature and so here i can scale up and scale down and i will pay for what i only use okay .

Second is outsourced means how do you do it and where u are getting it from where u are storing the back up etc things i don't need it okay

So on elastic means complete flexibility will be there in which layer which part and how many parts and what capacity and upto what time u need it so cloud is all about on demand and on outsourcing means getting work done so now what is azure then

Suppose i want to go to app service and i want to add any kind of service

Suppose i want to create or host a simple website after clicking add

So it is telling that go daddy and other will take money not pay as per use okay

Now u have to login into virtual machine and say which resource u want

So in resource group meta data is stored and lets go and do it

Go to all services there we will find different services based on category now the instance of service is nothing but a resource means u are creating a service and that service is one resource and we have to group them okay ..

Here the resource group is nothing but logical grouping of your resources okay ..check this

Now for first demo refer **video 2 in Cloud_CTS** okay it is clearly done try it out now next is creating a virtual machine

U can check the url notepad++ in desktop where all commands i had copied okay and before going for a demo u need to just check the command what to fire and all okay so just properly make a note okay will do later now

I am going for virtual machine setup where i will install virtual machine in for each slide i am giving notes down and i will copy the slides later now notes i will keep okay

Slide 1 :

So Next service which I am going to create is azure virtual machine service okay ..

So we can spin up different types of machine in azure cloud windows server or linux anything okay no need to buy hardware or buy necessary storage no need to check whether network is running or not and all those this

Slide 2:

How to deploy a virtual machine and how to connect to virtual machine When you deploy a virtual machine along with it lot of other aspects Will come Virtual machine is called as compute resource on azure platform it is like an infrastructure as a service Here the underlying physical servers are managed by azure and u can quickly host the virtual machine .

This virtual machine has a disc associated with it This is an OS disk just like normal disk for storing information in your computer Some disc are used for hosting the data and some disks are used for storage of OS

Then the virtual machine need to be a part of virtual network

We also have virtual network space card just like network card we have in computers All the data which is coming and going out of the computer is through this network interface it will go network card we can say

Just take that diagram and put it in white board and explain all parts that will be enough

When you have Network security group which is attached to the interface Control the inbound and outbound traffic

Then we have public IP address which will allow me to communicate to the computer through internet

Remember all the resources were getting created along with the virtual PC should be a part of resource group all those resource Acting as single resource only and it is part of resource group which is again a part of subscription which tells about our billing based upon the usage okay .

Slide 3:

Now let's check what goes into building of a virtual machine nothing is there here

Slide 4:

U can create using a resource or u can do it using a virtual machine as shown in diagram Now just series of slides will come i am just giving important points into it as combine okay

Here we go for Windows Server 2019 I am not going for Windows 10 because it requires licence means separately i need to create license and then virtual machine and server comes in built okay

And they will charge u on hourly basis means how much time the computer is on in cloud okay

Try to install more CPU and RAM into the computer o f virtual machine choose good plan for hard disks

Some configuration which i followed for installing virtual machines

The screenshot displays the Microsoft Azure portal interface. At the top, the browser address bar shows the URL: portal.azure.com/#@RaghavendraAdonioutlook.onmicrosoft.com/resource/subscriptions/97b56816-baa4-4192-9d1e-11ca9c4b65e9/resourceGroups/VirtualRG/pr.... The page title is "raghuvvm - Microsoft Azure". The main content area shows the details of a virtual machine named "raghuvvm".

Essentials

Resource group (move)	: VirtualRG	Operating system	: Windows (Windows Server 2019 Datacenter)
Status	: Running	Size	: Standard E2bs v5 (2 vcpus, 16 GiB memory)
Location	: East US 2 (Zone 1)	Public IP address	: 20.75.84.137
Subscription (move)	: Free Trial	Virtual network/subnet	: VirtualRG-vnet/default
Subscription ID	: 97b56816-baa4-4192-9d1e-11ca9c4b65e9	DNS name	: Not configured
Availability zone	: 1		
Tags (edit)	: Click here to add tags		

Properties | Monitoring | Capabilities (8) | Recommendations (1) | Tutorials

Virtual machine		Networking	
Computer name	: raghuvvm	Public IP address	: 20.75.84.137
Health state	: -	Public IP address (IPv6)	: -
Operating system	: Windows (Windows Server 2019 Datacenter)	Private IP address	: 10.0.0.4
Publisher	: MicrosoftWindowsServer	Private IP address (IPv6)	: -

Activate Windows
Go to Settings to activate Windows.

Microsoft Azure portal showing the 'raghuvm-nsg' Network Security Group. The page displays a list of security rules, including Inbound and Outbound rules.

Priority	Name	Port	Protocol	Source	Destination	Action
300	RDP	3389	TCP	Any	Any	Allow
310	Port_80	80	TCP	Any	Any	Allow
65000	AllowVnetInBound	Any	Any	VirtualNetwork	VirtualNetwork	Allow
65001	AllowAzureLoadBalan...	Any	Any	AzureLoadBalancer	Any	Allow
65500	DenyAllInBound	Any	Any	Any	Any	Deny

Priority	Name	Port	Protocol	Source	Destination	Action
65000	AllowVnetOutBound	Any	Any	VirtualNetwork	VirtualNetwork	Allow
65001	AllowInternetOutBound	Any	Any	Any	Internet	Allow
65500	DenyAllOutBound	Any	Any	Any	Any	Deny

Microsoft Azure portal showing the 'raghuvm_OsDisk_1' disk. The page displays the disk's essential information, including its size (127 GiB), state (Attached), location (East US 2), and subscription ID.

Resource group	Disk size	Disk state	Disk sku	Managed by	Operating system	Max shares	Availability zone	Performance tier	Security type
VIRTUALRG	127 GiB	Attached	Premium SSD LRS	raghuvm	Windows	0	1	P10 - 500 IOPS, 100 MBps	Standard

Metric	Value
Disk Bytes/sec (Throughput)	3.34MB/s
Disk Operations/sec (IOPS)	60/s

So till now all 3 demos worked and it is there in video as recorded

Next I am moving to some other topic now

Azure storage :

Act

Now i want to create an azure storage account here go to resources and say create resource so here u will do it as a resource only it is just a name of service on azure platform okay

So here I am already having an account now azure storage account means it is not an account is one kind of service which i will add it in the form of resource over here This account is used to provide storage on cloud

Depending upon the type of account you create different storage services are provided on azure in this azure general purpose v2 storage account type u will use and it provides four types

Blob types, tables and queues and files

We will discuss all of them okay

First create an azure storage account like this

So u can see here some unique name of storage account has to be given and type of account is standard i told that one only using here v2 account will give me four options blob for storing Objects ,files for storing file share ,queue for storing messages and table service for storing tables okay

If u choose other option it will tell me i will give u dedicated service in this area only i can give in blob then another i cannot give in single one dedicated i will give like that it will say okay

CloudNotes - Google Docs x Microsoft Azure - Beginner's Gu... x Create a storage account - Micro x +

Create a storage account

Basics Advanced Networking Data protection Encryption Tags Review + create

If you need to create a legacy storage account type, please click [here](#).

Storage account name ⓘ * raghustorage

Region ⓘ * ((US) East US) ▾

Performance ⓘ *
☐ Standard: Recommended for most scenarios (general-purpose v2 account)
☒ Premium: Recommended for scenarios that require low latency.

Premium account type ⓘ * Page blobs ▾

Redundancy ⓘ *
Block blobs:
Best for high transaction rates or low storage latency
File shares:
Best for enterprise or high-performance applications that need to scale
Page blobs:
Best for random read and write operations

Review + create

Activate Windows
Go to Settings to activate Windows.

Type here to search

21:33
31-05-2022

So that is why i am using standard type v2 account here okay

An next option is redundant storage I am using means it is like back up means if any thing crashes i want to have a redundant copy of it okay so now local i am keeping it

Now remaining all tabs i will leave default and create the account now okay

So like this it will create okay so in this containers is for blob types okay ..and remaining we know it already okay

Now go to containers where it can store objects. These objects can be videos ,images and normal files also and all of these objects which i am keeping in the container can be accessed using a unique url okay .

So first create an container

Microsoft Azure portal interface showing the 'New container' dialog box. The 'Name' field is set to 'data'. The 'Public access level' is set to 'Private (no anonymous access)'. A red arrow points from the 'Containers' link in the left sidebar to the 'New container' dialog.

Containers

Name	Last modified	Public access level
logs	5/31/2022, 9:41:35 PM	Private

Full-screen Snip

Activate Windows
Go to Settings to activate Windows.
Create Discard

Microsoft Azure portal interface showing the 'Containers' page. A notification banner at the top right says 'Successfully created storage container'. The table shows two containers: 'logs' and 'data'. The 'data' container is highlighted.

Containers

Name	Last modified	Public access level	Lease state
logs	5/31/2022, 9:41:35 PM	Private	Available
data	5/31/2022, 9:55:42 PM	Private	Available

Activate Windows
Go to Settings to activate Windows.

Now click on data container and go inside it okay

Now once container is in place and now i can start uploading things into the container

So after uploading

U can see the screenshot of the image

Same thing if i do for pdf file we can't see it

From the top only navigate go to data

Unable to edit button not happening then

But we can download that pdf file into my local machine okay now go back to container

And click any of data element

Unique url it has

Copy the url and paste it in browser

Like this u will get it okay

Why unable to access means because permission has to be given mine was private access so i cannot put public here okay

So go to container and there change access level to

CloudNotes - Google Docs x Microsoft Azure - Beginner's Gui x data - Microsoft Azure x https://raghustorage.blob.core.w x +

data Container

Search (Ctrl+/) « Upload Change access level Refresh Delete Change tier Acquire lease Break lease View snapshots Create snapshot

Change access level

Change the access level of container 'data'.

Public access level ⓘ Blob (anonymous read access for blobs only) v

⚠ Blobs within the container can be read by anonymous request, but container data is not available. Anonymous clients cannot enumerate the blobs within the container.

OK Cancel

Activate Windows
Go to Settings to activate Windows.

Now after doing this refresh the url

So u will get it like this okay

Same thing do it for pdf also okay

So pdf also I can see it okay ..

If u go to data container

The screenshot shows the Microsoft Azure portal interface for a storage container named 'data'. The left sidebar contains navigation options: Overview, Diagnose and solve problems, Access Control (IAM), Settings, Shared access tokens, Access policy, Properties, and Metadata. The main area displays the container's overview, including the authentication method (Access key) and location (data). A table lists the blobs in the container:

Name	Modified	Access tier	Archive status	Blob type	Size	Lease state
sachin.jpg	5/31/2022, 10:00:56 ...	Hot (Inferred)		Block blob	77.35 KiB	Available
ss.pdf	5/31/2022, 10:01:17 ...	Hot (Inferred)		Block blob	1.16 MiB	Available

The 'Access tier' column is circled in red, highlighting the 'Hot (Inferred)' status for both blobs. The bottom of the screen shows the Windows taskbar with the search bar and system tray.

Something we have hot as an access tier okay ...it is set default and if u are accessing them frequently then make them as hot tier okay ...

When u want to reduce the storage cost then cool and archive one u can they are also one of the types okay ..cool is less and archive is still less and we need them when we data increase okay

Go to the image and change tier

Microsoft Azure portal interface showing the 'Change tier' dialog for a blob named 'sachin.jpg'. The dialog lists 'Hot (Inferred)', 'Cool', and 'Archive' as options. A red handwritten note '30 - 180 days' is written over the 'Cool' option. The background shows the blob's properties, including 'Access Tier: Hot (Inferred)' and 'Size: 77.35 KiB'.

3 options are there in cool it must be 30 days minimum and archive is the cheapest minimum 180 days u need to keep it and if i am changing it to archive

Microsoft Azure portal interface showing the 'Change tier' dialog for a blob named 'sachin.jpg'. The 'Archive' option is selected. A blue informational message states: "Setting the access tier to "Archive" will make your blob inaccessible until it is rehydrated back to "Hot" or "Cool", which may take several hours." The background shows the blob's properties, including 'Access Tier: Hot (Inferred)' and 'Size: 77.35 KiB'.

It is telling me that if u change again to come back to hot tier it will take several hours and after doing this also i cannot edit or download and all as it has gone to archive mode u can test it by doing it but i am not doing it okay

Next data redundancy concept explained in your own way ...region wise etc and all tell u have to pay more cost and now I will write one program in console application and try to work with blob types using the program okay ...

Now using a .net program i want to interact with azure blob

Open a simple console application in C# .net core

Next create an new local storage again or I am using this one only now

Some code i will write in console application which will upload some data to that blob storage

Before that i need to install some package to interact with that storage account in vs2019 okay

Go to tools →options

In the search box put package

And then

If i am going to package source under nugget package manager

It is already something set already there no need to add

So what i am doing is that the official site which is having a package for dotnet is made available in vs2019 editor also ..

Next

Select the project and say install okay

Using 10 versions and anything is okay ..

It is installed next

Replace the code in vs console with this code

```

using Azure.Storage.Blobs;
using System;
using System.IO;
using System.Threading.Tasks;

```

```
namespace newapp
```

```
{
```

```
    class Program
```

```
    {
```

```
        static string str_connection =
```

```
            "DefaultEndpointsProtocol=https;AccountName=newstore40000;" +
```

```
            "AccountKey=p5TrF9F1eV7Mf/bBc5Y+8atKaBu4dnJzrElYeZl7qxUe9aqnmwbPUHgkdPKxQLbh
            uOUrcyXo6ghMOI1d7BbQiA==;EndpointSuffix=core.windows.net";
```

```
        static async Task Main()
```

```
        {
```

```
            BlobServiceClient blobServiceClient = new BlobServiceClient(str_connection);
```

```
            BlobContainerClient container_client =
```

```
            blobServiceClient.GetBlobContainerClient("data");
```

```
            BlobClient blob_client = container_client.GetBlobClient("sample.txt");
```

```
            using FileStream uploadFileStream = File.OpenRead("C:\\tmp\\sample.txt");
```

```
            await blob_client.UploadAsync(uploadFileStream, true);
```

```
            uploadFileStream.Close();
```

```

        Console.WriteLine("File uploaded");

        Console.WriteLine("Operation complete");
    }
}
}

```

Firs I need to add connection string u can see there in code okay

So go to storage account and then access key like this

Here u can take key1 or key 1 and say show and copy the connection string

There in program replacing earlier one

```

using Azure.Storage.Blobs;
using System;
using System.IO;
using System.Threading.Tasks;

```

```

namespace newapp
{
    class Program
    {
        static string str_connection =

```

```
"DefaultEndpointsProtocol=https;AccountName=raghustorage;AccountKey=PzdMBAwbUtnHQ/hlcm7/oEj+7Uos9fNXd1mP3AEv74b9vqT+C70cbO4po64GEG+kncNd3kPBPNNHh+AStmP7CJg==;EndpointSuffix=core.windows.net";
```

```
static async Task Main()
{
    BlobServiceClient blobServiceClient = new BlobServiceClient(str_connection);
    BlobContainerClient container_client =
blobServiceClient.GetBlobContainerClient("data");

    BlobClient blob_client = container_client.GetBlobClient("sample.txt");
    using FileStream uploadFileStream = File.OpenRead("C:\\tmp\\sample.txt");
    await blob_client.UploadAsync(uploadFileStream, true);
    uploadFileStream.Close();
    Console.WriteLine("File uploaded");

    Console.WriteLine("Operation complete");
}
}
```

And i have kept that file in that location to upload from there

Not getting so using another file now checking container data

The screenshot shows the Microsoft Azure portal interface for a container named 'data'. The left sidebar contains navigation options: Overview, Diagnose and solve problems, Access Control (IAM), Settings, Shared access tokens, Access policy, Properties, and Metadata. The main area displays the container's contents in a table:

Name	Modified	Access tier	Archive status	Blob type	Size	Lease state
sachin.jpg	5/31/2022, 10:00:56 ...	Hot (Inferred)		Block blob	77.35 KiB	Available
sample.txt	5/31/2022, 11:31:36 ...	Hot (Inferred)		Block blob	4.24 KiB	Available
ss.pdf	5/31/2022, 10:01:17 ...	Hot (Inferred)		Block blob	1.16 MiB	Available

A red arrow points to the 'sample.txt' row. The top of the page shows the 'data' container name and various action buttons like Upload, Change access level, Refresh, Delete, etc. The bottom of the page shows the Windows taskbar with the search bar and system tray.

Upload means name is sample but content from atlog file is there okay

The screenshot shows the Microsoft Azure portal interface for the 'sample.txt' blob. The left sidebar is the same as the previous screenshot. The main area displays the blob's details, including its name, location, and access tier. The blob content is shown in a text editor:

```
1 _FN_SE C:\Users\WINDOW~1\AppData\Local\Temp\{ADAC87AF-85F3-11D5-BE00-00500ABA03B8}\Ins
2 Is WinNT
3 End Dialog
4 Is WinNT
5 ie2-CtrateDir :C:\WINDOWS\Downlo~1\Webex

7 ret YES -- C:\WINDOWS\Downlo~1\Webex\316
8 C:\WINDOWS\Downlo~1
9 Is WinNT
10 Delete STD
11 lpsz95INT = NT gpcFileName = C:\WINDOWS\Downlo~1\Webex\316\Other\gpcNT.ini
12 keyArray =
13 keyArray =
```

The bottom of the page shows the Windows taskbar with the search bar and system tray.

Now i am deleting all the containers as now i am moving to code for sql azure now okay

Now we will look into azure sql database server u want to install sql server in azure

If u are installing sql server through an virtual machine then u need to configure the server manually and see its hight availability etc and but i want to do it as a platform as a service so when i do like this backups and infrastructure is managed by them

As it is written in slide

Now let us create a resource based on azure sql database service

So in all resources tab and click create resource

Select sql database

So here i move to server creation okay

Here two things are created db server and db also okay server is invisible and in side server database will be there and and those after creating in cloud i will just use client sql server management studio for it okay

Filled the details and pass word is DBPassword#123

After clicking okay

Click configure database

portal.azure.com/#create/Microsoft.SQLDatabase

U can see the cost and change setting cost will vary and 2 gb i had kept it okay

Leaving like this move

Go to networking

So here in networking what will happen is that through laptop i want to talk to db through azure db server and i need internet so firewall will try to stop me u have to write some rules to ensure connectivity okay

Change this setting and explain it it is clear only

So that's all don't change now go to all tabs and finally create it okay

Go to resource now

The screenshot shows the Microsoft Azure portal interface. The top navigation bar includes the Microsoft Azure logo, an 'Upgrade' button, and a search bar. The user is logged in as 'RaghavendraAdoni@ou...'. The main content area displays the details of a newly created SQL database named 'newdb' (newdbserveradoni/newdb). The left sidebar contains a navigation menu with options like Overview, Activity log, Tags, Diagnose and solve problems, Getting started, Query editor (preview), Power Platform, Power BI, Power Apps, Power Automate, Settings, Compute + storage, Connection strings, Properties, and Locks. The main content area shows the 'Essentials' tab with various properties: Resource group (DatabaseRG), Status (Online), Location (East US), Subscription (Free Trial), Subscription ID (97b56816-baa4-4192-9d1e-11ca9c4b65e9), Tags (edit), Server name (newdbserveradoni.database.windows.net), Elastic pool (No elastic pool), Connection strings (Show database connection strings), Pricing tier (Basic), and Earliest restore point (No restore point available). Below these properties, there is a 'Compute utilization' section with a line chart showing usage over the last 1 hour, 24 hours, and 7 days. To the right of the chart is a 'Database data storage' section showing a circular gauge with '0.2% USED SPACE'. The bottom of the screen shows the Windows taskbar with the search bar and several application icons.

Form there only selecting the menu all resources i can see

The screenshot shows the Microsoft Azure portal interface with the 'All resources' view selected. The top navigation bar is the same as the previous screenshot. The main content area displays a list of resources. At the top, there is a 'Filter for any field...' dropdown and several filter buttons: 'Subscription == all', 'Resource group == all', 'Type == all', and 'Location == all'. Below the filters, there is a table with the following columns: Name, Type, Resource group, Location, and Subscription. The table contains two rows of resources:

Name	Type	Resource group	Location	Subscription
newdb (newdbserveradoni/newdb)	SQL database	DatabaseRG	East US	Free Trial
newdbserveradoni	SQL server	DatabaseRG	East US	Free Trial

At the bottom of the table, there is a pagination bar showing 'Showing 1 to 2 of 2 records'. The bottom of the screen shows the Windows taskbar with the search bar and several application icons.

So two resources are created

Now open sql server management studio in admin mode

Newdbserveradoni.database.windows.net

So copy this into sql server

User name and pass word which i had mentioned okay

So connected to the server on cloud okay

Further expanding

And in this query ...

```
CREATE TABLE Course
(
```

```
CourseID int,  
CourseName varchar(1000),  
Rating numeric(2,1)  
)
```

```
INSERT INTO Course(CourseID,CourseName,Rating) VALUES(1,'AZ-204 Developing Azure  
solutions',4.5)
```

```
INSERT INTO Course(CourseID,CourseName,Rating) VALUES(2,'AZ-303 Architecting Azure  
solutions',4.6)
```

```
INSERT INTO Course(CourseID,CourseName,Rating) VALUES(3,'DP-203 Azure Data  
Engineer',4.7)
```

```
SELECT * FROM Course
```

Write the commands and see the output okay
